ОТЧЕТ

ПО

ЛАБОРАТОРНОЙ РАБОТЕ №3

«Введение в алгоритмическую и

высокоуровневую оптимизацию на примере

задачи умножения матриц»

учебная дисциплина «Параллельные вычисления»

Студент: Голубев И. М., БПМ-22-ПО-1

Преподаватель: Ватутин Э. И.

Оценка:

Дата защиты: 30.03.2026

2026 г.

Введение

Основная цель работы:

Познакомиться с базовыми принципами определения вычислительных возможностей и аппаратной конфигурации CPU.

Описание решаемой задачи

Задача:

Разработать программу для опроса процессора с использованием команды CPUID и вывода полученной информации в удобной для пользователя форме (оконное приложение, консольное приложение с выводом на экран или в файл).

Решено было реализовать консольное приложение с выводом информации в терминал.

Входные данные:

Дополнительных аргументов для консольного приложения не предусмотрено.

По сути, нужно реализовать Linux утилиту **cpuid** (см. Рис. 1)

```
 one-eyed-john@fedora  ~  cpuid
CPU 0:
   vendor_id = "GenuineIntel"
   version information (1/eax):
      processor type  = primary processor (0)
      family          = 0x6 (6)
      model           = 0x5 (5)
      stepping id     = 0x2 (2)
      extended family = 0x0 (0)
      extended model  = 0xa (10)
      (family synth)  = 0x6 (6)
      (model synth)   = 0xa5 (165)
   miscellaneous (1/ebx):
      process local APIC physical ID = 0x0 (0)
      maximum IDs for CPUs in pkg    = 0x10 (16)
      CLFLUSH line size              = 0x8 (8)
      brand index                    = 0x0 (0)
   brand id = 0x00 (0): unknown
   feature information (1/edx):
      x87 FPU on chip                        = true
      VME: virtual-8086 mode enhancement     = true
```

Рис. 1. Результат выполнения встроенной команды **cpuid**

Результат:

Максимально полная информация о процессоре.

Выбранные средства для разработки

Для выполнения лабораторной работы использовались следующие программные средства и технологии:

- Язык программирования: C++17
- Среда разработки: Zed
- Операционная система: Fedora Linux
- Процессор: Intel(R) Core(TM) i5-10300H CPU @ 2.50GHz
- Компилятор: g++
- Сборка программы: g++ -std=c++17 -O2 lab03.cpp -o build/cpuid_lab03

Листинг кода программы

Код доступен в удалённом Github репозитории по ссылке:

https://github.com/g0lubew-iv/parallel-comp/blob/main/lab03/lab03.cpp

Ниже приведён полный листинг:

```

Выводы

Проведено знакомство с базовыми принципами определения вычислительных возможностей и аппаратной конфигурации CPU.

Результатом стала реализация стандартной утилиты cpuid.
